Bridge to Open Platform

Overview

Open Options partners with Mercury Security to provide simple, cost-effective bridge solutions to transition end-of-life or proprietary systems to an open platform. Open Options offers three bridge integrations that offer customers not only a better solution, but also a more cost-effective long-term investment.

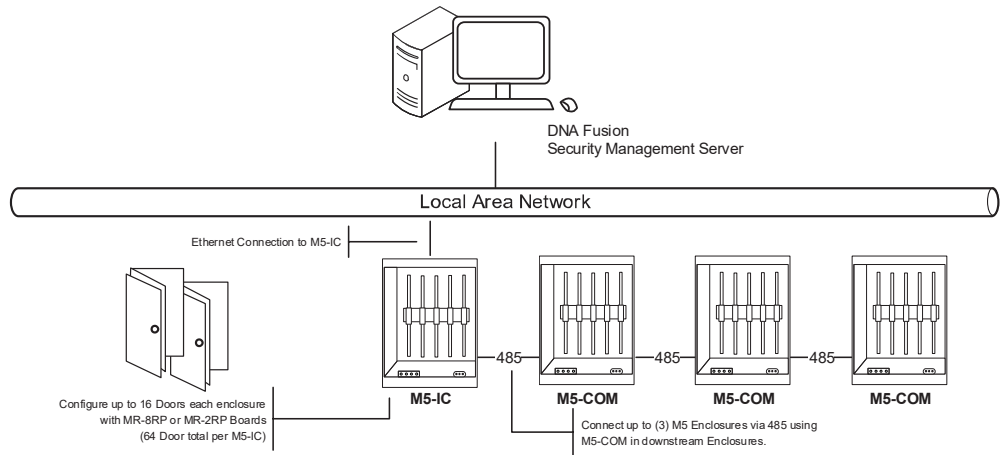

These key retrofit solutions are designed to replace Casi Rusco Micro, Vanderbilt and Software House® panels with Authentic Mercury boards or controllers, removing the need for an expensive and time consuming rip and replace.

Bridge integrations generally allow end users to maintain existing enclosures, power and wiring connections leaving field devices untouched throughout the installation process. Users will also be able to take advantage of an enhanced software experience with Open Options DNA Fusion access control.

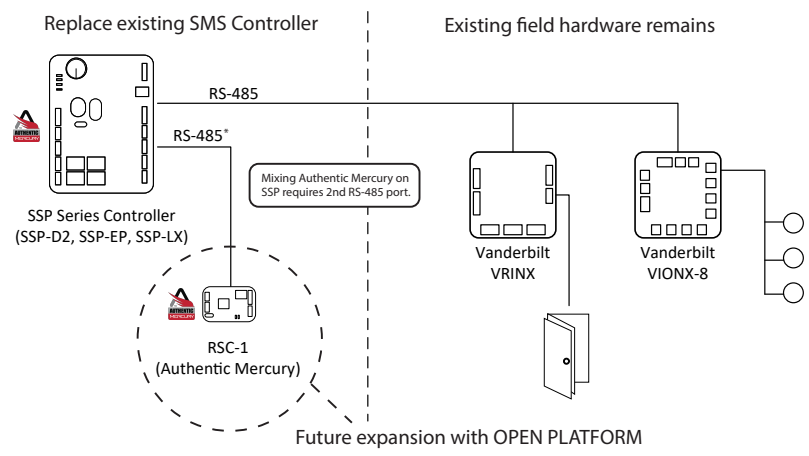

For more information on specific bridge integration details please refer to individual datasheets or contact your sales rep today.
